## 4-1 RF CIRCUITS

The RX signal from the antenna is passed through the LPF (L36, L39, L41, L42, C291, C295, C296, C298, C300, C303, C304, C306, C307), antenna SW (D29–D32) and tuned BPF (D23, L34, C279), and then applied to the RF AMP (Q32).

The amplified RX signal is passed through a two-staged tuned BPF (D22, D34, L27, L28, C213, C224, C227, C236, C238, C242, C249), and then applied to the 1st IF circuits.

### • RF CIRCUITS

## 1ST IF CIRCUITS

The RX signal from the RF circuits is applied to the 1st mixer (Q28), to be mixed with the 1st LO signal from the RX VCO (Q14, D10–D11, L6), resulting in the 46.35 MHz 1st IF signal. The 1st IF signal is passed through the 1st IF filter (FI3) to remove unwanted signals, and then applied to the 1st IF AMP (Q27). The amplified 1st IF signal is applied to the 2nd IF circuits.

### • 1ST IF CIRCUITS

## 2ND IF CIRCUITS

The 1st IF signal from the 1st IF circuits is applied to the IF IC (IC3).

The IF IC contains the 2nd mixer, 2nd IF AMP, detector, and so on, in its package.

The 1st IF signal is mixed with the 2nd LO signal at the internal 2nd mixer, resulting in the 455 kHz 2nd IF signal. The 2nd IF signal is passed through the 2nd IF filter (FI1: for wide mode, FI2: for narrow mode) to remove sideband noise, and then applied to the internal 2nd IF AMP. The amplified 2nd IF signal is applied to the quadrature detector circuit for frequency-demodulation.

The demodulated AF signal is output from the IF IC (pin 9), and then applied to the RX AF circuits on the LOGIC UNIT.

### • 2ND IF CIRCUITS

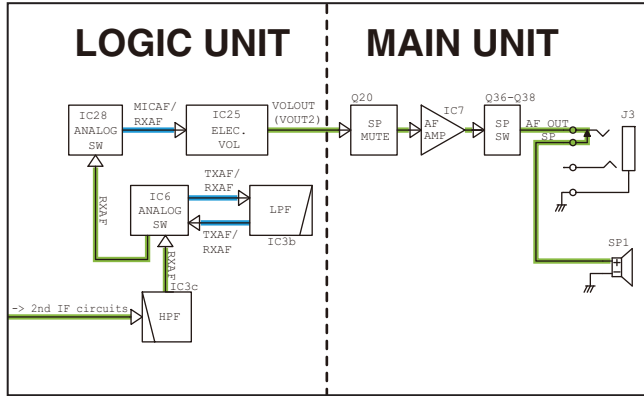

## RX AF CIRCUITS

The demodulated AF signal from the MAIN UNIT is passed through the HPF (IC3c), AF line SW (IC6), LPF (IC3d), AF line SW (IC6), another AF line SW (IC28) and the electronic volume (IC25) for adjustment in level. The level-adjusted AF signal is applied to the MAIN UNIT.

The AF signal is applied to the AF AMP (IC7), through the speaker mute SW (Q20). The amplified AF signal is output to the internal speaker through the speaker mute SWs (Q33, Q35–Q37), or external speaker through the speaker mute SW (Q36, Q37) and the [SP] connector.

### • RX AF CIRCUITS

## SQUELCH CIRCUIT

The squelch circuit cuts off the AF output signal while no RF signal is received. Detecting noise components in the demodulated AF signal, the squelch circuit stops audio signal from being emitted.

A portion of the demodulated AF signal from the IF IC (IC3) is passed through the D/A converter (IC5) for level (=threshold) adjustment. The level-adjusted AF signal is passed through the noise filter (IC3, pins 7, 8 and R37, R39, R40, R191, C52, C53, C308) to filter only the noise components (approximately 30 kHz signals). The noise components are rectified by the noise detector, resulting in a DC voltage corresponding to the noise level.

When the noise level is higher than the preset one, the internal comparator sets the "NOIS" signal to the CPU to "High," and then the CPU controls the speaker mute SW (Q20) to stop audio signal from being emitted.

## 4-2 TX AF CIRCUITS

The AF signal from the microphone (MIC signal) is applied to the MIC AMP (IC3a), through the [MIC] jack. The amplified MIC signal is passed through the AF line SW (IC28) and the electronic volume (IC25) for adjustment in level. The level-adjusted AF signal is applied to the IDC (IC3d) which functions as the splatter filter.

The filtered MIC signal is passed through another AF line SW (IC6) and LPF (IC3b), then fed back to the AF line SW (IC6), and then applied to the modulation circuit on the MAIN UNIT.

### • TX AF CIRCUITS

## MODULATION CIRCUIT

The MIC signal from the LOGIC UNIT is applied to the D/A converter (IC5) for adjustment in level (=deviation). The level-adjusted MIC signal is applied to the TX VCO (Q13, D7–D9) as a modulation signal.

The modulated TX VCO output signal is amplified by the LO AMP (Q17), and then applied to the TX AMP circuit as the TX signal, through the buffer (IC10), LO SW (D13) and another buffer (Q21).

### • MODULATION CIRCUITS

## TX AMP CIRCUITS

The TX signal is sequentially amplified by the pre-drive (Q22), drive (Q26) and power AMP (Q29). The amplified TX signal is applied to the antenna, through the ANT SW (D24, D25) and LPF (L36, L39, L41, L42, C291, C295, C296, C298, C300, C303, C304, C306, C307).

## APC CIRCUIT

The voltage produced on both sides of L39 is rectified by D27 and D33, and used as the TX power sensing voltage. The voltage is applied to the APC AMP (IC9b), and the output voltage controls the gate voltages of Q29, Q26 and Q22.

The voltage difference between both sides of R157 is detected by IC9d, to control the TX power when abnormal current is detected.

### • TX AMPLIFIER AND APC CIRCUITS

### 4-3 FREQUENCY SYNTHESIZER

The 2300H has two VCOs; TX VCO and RX VCO.

While transmitting, the TX VCO (Q13, D7–D9, L5) is activated. The oscillating frequency is set by the value of C89, L5, D7 and D8. Applying the voltage to both D7 and D8, the wide oscillating frequency range is obtained. The modulation signal is applied to D9 to obtain Frequency Modulation.

While receiving, the RX VCO (Q14, D10–D11, L6) is activated. The oscillating frequency is set by the value of C88, L6, D10 and D11. Applying the voltage to both D10 and D11, the wide oscillating frequency range is obtained.

Q6, Q7 and Q8 compose a power supply line SW which toggles the TX and RX VCOs.

The output signal from each VCO is passed through the buffer (Q17) and applied to the PLL IC (IC1).

IC1 phase-compares the output of TCXO (X1) and VCO, and the phase-difference is output as the charge pump current. The current is passed through the loop filter to be converted into the lock voltage, which controls the oscillating frequency of each VCO.

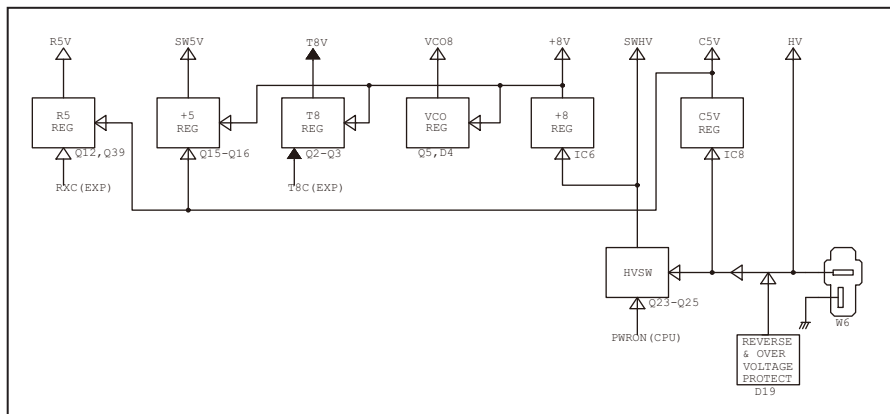

The output of Q17 is passed through the buffer (IC10), and used as the TX/RX LO signal.
