Frequency Configuration

The TM-541A/E utilizes a PLL synthesizer system and digital VFO. The VFO is capable of tuning in 10 kHz, 12.5 kHz, 20 kHz, and 25 kHz steps.

The receiver system configuration is based upon double superheterodyne principles with a first intermediate frequency (IF) of 59.7 MHz and a second intermediate frequency of 455 kHz. The transmit signal generated by the PLL (Phase Locked Loop) circuit, oscillating at one half the fundamental frequency is directly modulated, amplified and applied to the antenna.

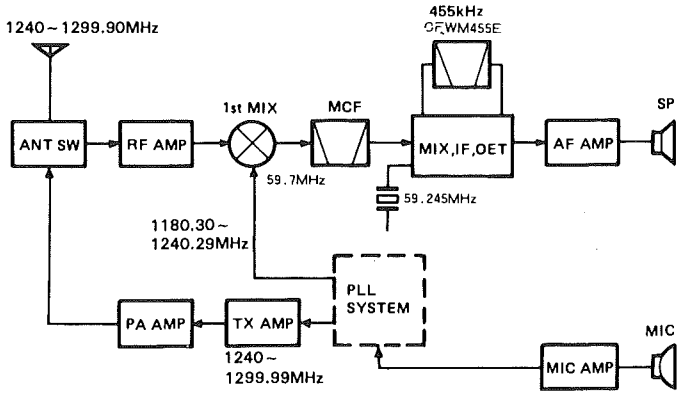

Fig. 1 Frequency configuration diagram

Receiver System

• General

Incoming signals from the antenna pass through a low pass filter circuit in the transmitters final stage, then through the transmit/receive switching diodes, and then to the front end of the receiver.

The incoming signals are amplified by a microwave GaAs (Gallium Arsenide) FET and enter a two-pole helical reasonator. The signals are then passed through an additional microwave GaAs FET and two-pole helical reasonator in order to remove any remaining undesirable components. The signal is then applied to the first mixer. The front end of this transceiver is matched thru the use of a microstrip line in order to obtain high sensitivity and reliability. The first mixer employs a GaAs FET that provides excellent two-signal characteristics. The incoming signal is combined with the first local oscillator signal from the PLL unit and converted into the first IF signal of 59.7 MHz. Undesirable harmonics are removed from the IF signal by a two stage MCF (Monolithic Crystal Filter).

The first IF signal is amplified and applied to the FM IF HIC (IC2: KCD04). The incoming IF signal is mixed with the second local oscillator frequency (59.245 MHz) to obtain the second IF frequency of 455 kHz. This signal is then applied to a six element ceramic filter (CFWM455E) to sharpen the signal quality and fed back into IC2 for additional amplification. The output signal from the IC2 is then fed into a power amplifier via the audio volume control for application to the speaker.

• S-Meter Circuit

S-meter control voltage from IC2 (KCD04) in the FM IF HIC is fed into the control circuit. The CPU converts the voltage from an analog to a digital signal in order to operate the LCD bar meter.

CIRCUIT DESCRIPTION

Transmitter System

• Outline

The basic configuration of the transmitter section is that of an oscillator circuit operating at 1/2 the desired operating frequency is directly modulated by using a varactor diode. This signal is then doubled, amplified and applied to the antenna circuits.

• Modulation Circuit

Voice signals from the microphone enter the transmitter via three op amps. These operational amplifiers perform pre-emphasis, amplification, limiting, and includes a splatter filter, which is used to reduce undesirable high-frequency components from the signal. A portion of the incoming audio signal is taken from the output of the amplifier and is applied to the microphone check circuit that is used in the low power setting of the radio. The FM modulation circuit applies this signal directly to the VCO via a varactor diode.

• PreAmplifier Circuit

The output signal from the VCO enters the pre-amplifier (HIC). The value of this circuit is that it provides high quality signal amplification since it is always operating in its linear range.

• Final Amplifier Circuit

The signals from the pre-amplifier stage and DRIVE HIC: KCB07 enter the final module where they are boosted to the desired final output level. This transceiver uses a large heat sink to prevent failure of the final amplifier due to temperature. It is designed to provide efficient radiation of the heat generated by the final amplifier.

• APC Circuit (Automatic Power Control)

The automatic power control circuit (APC) uses a diode to detect a portion of the output from the final module. It amplifies this signal and uses it as a control voltage. This control voltage is inversely proportional to the output so that a constant output is produced.

CIRCUIT DESCRIPTION

• Antenna Switching Circuit

The antenna switching circuit is shown in **Fig. 2**. The receive circuit consists of a two stage cutoff circuit that is formed by 1/4 wavelength striplines which provide low insertion loss and good isolation.

A PIN diode is used as a switching element because of its small junction capacitance, and because its high frequency capacitance is relatively independent of reverse bias voltages. **Fig. 3** shows the equivalent circuit for the transmit section.

The switching diodes are forward biased whenever the 8T (8 volts on transmit) is active. During transmit, the apparent impedance felt on the two 1/4 wavelength strip lines is very high (Point A) which prevents power from being coupled into the receiver section. This ensures maximum power is transferred to the antenna and protects the receiver front end from possible overloading.

The equivalent circuit for receive is shown in **Fig. 4**.

During receive the 8T line is held low which causes the PIN diodes to be reverse biased. This presents a high impedance to the incoming receive signals, effectively blocking them from the transmit section. The two 1/4 wavelength striplines present a low impedance to the small signal levels of the incoming receive signal and allow the signals to pass along to the receiver circuits.

In practice the junction capacitance of the PIN diodes will never reach zero so that the impedance of one circuit (Zout) might influence the other, to a small extent. Diodes are provided to reduce this junction capacitance, and thus the effect of this interaction between circuits.

CIRCUIT DESCRIPTION

PLL Synthesizer Unit

A block diagram of the PLL unit is provided in **Fig. 5**. The PLL unit of the TM-541A/E is constructed so that the VCO unit is contained in a separate shielded case that forms its own subassembly. This technique results in improved electrical and mechanical stability, which increases the overall frequency stability of the radio.

The VCO oscillates at a frequency of 600 MHz. Its second harmonic (1200 MHz) is amplified by transistor Q2 in order to obtain a useable 1200 MHz signal. This signal is then amplified by Q54. Here the signal is divided by 128 or 129. The resulting signal is applied to the phase comparator (MB1501PF) to obtain the correction voltage that is used to lock the VCO on frequency. A TCXO (Temperature Compensated Crystal Oscillator) reference oscillator operates at 12.8 MHz which helps to reduce frequency drift and offers high stability.

A frequency of 10 or 12.5 kHz is used to compare the signal obtained by dividing the 12.8 MHz TCXO frequency by 1/1280 or 1/1024 in order to provide the various tuning steps of 10, 12.5, 20, and 25 kHz.

The relationship between the fvco (RX) and the various division ratios is explained below:

- fvco (RX) = fRX − 59.7 = {(n × 128) + A} × fosc ÷ R
- fvco (RX): The output frequency (Q2 output) of the VCO during receive
- fRX: Receive frequency
- n: Set value of the binary 10 bit programmable counter

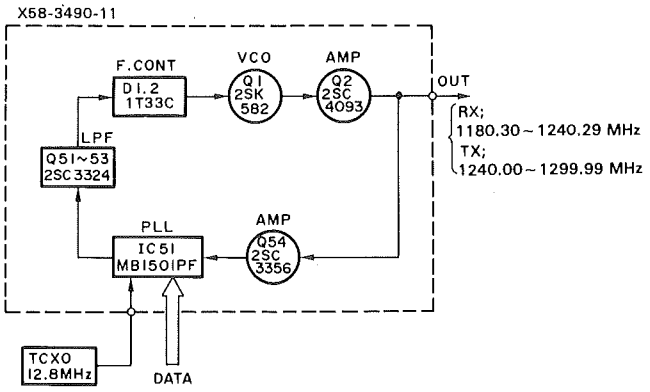

Fig. 5 Block diagram of the PLL unit

- fosc: Standard Oscillator Frequency 12.8 MHz (TCXO)
- R: Set value of the binary 14-bit programmable reference counter
- 1024 (for the 12.5 and 25 kHz steps)
- 1280 (for the 10 and 20 kHz steps)

In the case of 1260 MHz,

- fvco (RX) = 1260 − 59.7
  = {(n × 128) + A} × 12800 ÷ 1280
  = 1200.300 MHz

where n = 937 and A = 94.

For transmitting,

- fvco (TX) = 1260 = {(n × 128) + A} × 12800 ÷ 1280
  = 1260.000 MHz

where n = 984 and A = 48.

CIRCUIT DESCRIPTION

• ALT (Automatic Frequency Locked Tuning) Circuit

The block diagram of the ALT unit is shown in **Fig. 7**.

The ALT system uses a portion of the second local oscillator signal, mixer, and the FM IF HIC: KCD04 module to form a feed-back circuit that is used to provide analog automatic frequency control.

When the first IF (59.7 MHz) changes due to a shift in the transmitter frequency a corresponding shift will occur in the second intermediate frequency. A portion of this second IF signal is detected. This correction voltage is amplified (NJM4558M) and is used to control D1 and D2 via analog switch MN4066BS. TP1 can be used to check the value of this control voltage. D1 and D2 are in series with the 59.245 MHz oscillator circuit and provide voltage control of this oscillator (VCXO, Voltage controlled oscillator). Therefore, fluctuations of the second IF cause a corresponding change in the second local oscillator circuit, which keeps the frequency of the second IF within the bandwidth of the IF filter. This system maintains close agreement between the transmit and receive frequency bandwidths. (In practice, the receiver frequency and transmit frequency are automatically maintained in close agreement.) The center voltage of the vari-cap diode is set by a voltage divider circuit. Stability of this voltage is maintained by a voltage follower circuit. When the ALT circuit is off, the control voltage applied to the vari-cap diode is switched to this fixed voltage divider circuit in order to set the second local oscillator frequency.

The control voltage for the vari-cap diode is subject to one additional voltage divider stage. During receive this DC signal is applied from the RM line to the microprocessor terminal PTH02 which turns on the tuning indicator light. Switching is performed by the 8R line.

The relationship between the input voltage on the PTH02 terminal and the tuning indicator, and the relationship between the RM voltage and the deviation during receive is shown in **Table 5** and **Fig. 8**.

CIRCUIT DESCRIPTION

• Unlock circuit

When the PLL is unlocked, the base of Q16 is off with OV, turning Q16 off: As a result, the collector of Q16 becomes 8 V. This turns Q16 off and Q14 on, then turns Q12 off. Therefore, when the PLL is unlocked, Q12 is off removing bias voltage from the 8T line. Without the 8T voltage no transmit signal is generated.

Digital Control Unit

• Overview

The digital control unit consists of a several keys, a rotary encoder input, a display, a reset circuit, a back-up circuit, and a tone output circuit. These circuits are controlled by a single microcomputer (CPU).

• Key and rotary encoder input circuits

The keys on the panel are arranged in matrix. Key input is fed into the CPU, using a key scan technique. Output from the rotary encoder is fed directly into the CPU.

• Microphone key input circuit

The UP, DOWN, and other function keys of the microphone are directly connected to their corresponding analog input pins of the CPU. Each of the functions is activated by a voltage generated when the corresponding key is pressed.

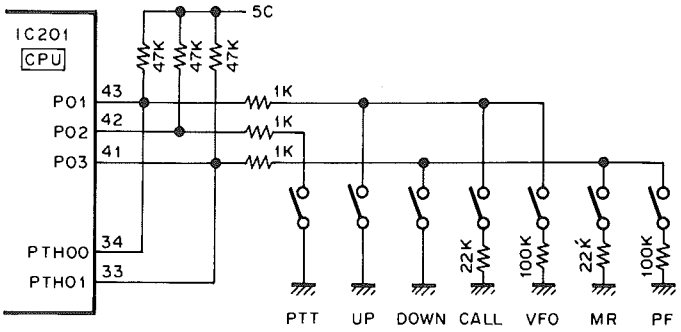

Fig. 10 Microphone key input circuit

CIRCUIT DESCRIPTION

• Reset and back-up circuits

When the TM-541A/E power is turned on, the reset circuit sends a "L" level pulse to the RESET pin of the CPU for approx. 3ms. This initiates the power-on reset sequence.

When the TM-541A/E power is turned off, the backup circuit detects a voltage drop in the 5C line and sets CPU INT4 to a "H" level. This causes the CPU to enter a back-up state.

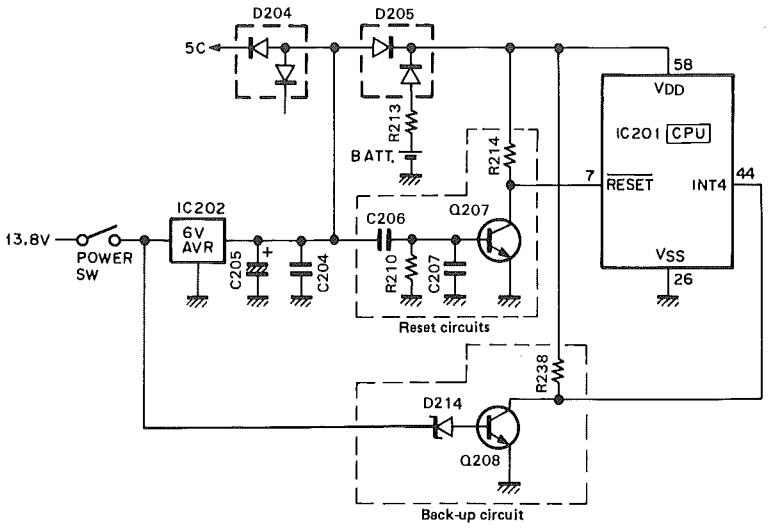

Fig. 11 Reset and back-up circuits

• Shift register circuit

The shift register circuit consists of IC5 (TC9174F). The IC5 receives serial data from the microcomputer to perform the controls listed below.

Pin No.	Pin name	Function
1	GND	
2	ALT	Usally "L"
3	B1	Usually "L"
4	CE	Electronic VOL select: "H" when electronic VOL selected, "L" when panel VOL selected or interface connected.
5	VOLD	Electronic VOL DOWN: "L" when DOWN key ON.
6	VOLU	Electronic VOL UP: "L" when UP key ON.
7	MUTE	AF MUTE: "H" when TX mode, AL 1ch receive mode, CTCSS, bell, or squelch is ON.
8	T/R	Transmit/receive select: "H" in RX mode, "L" in TX mode.
9	TXH	TX power select: "H" in HI mode, "L" in LOW mode.
10	—	Open.
11	B2	Usually "H"
12	—	Open.
13	DP	Serial data input.
14	CP	Clock input.
15	EP2	Enable input.
16	5C	

• Display circuit

The display circuit is contained in the LCD assembly. It consists of a LCD driver, its peripheral circuits, and an LCD. The LCD is dynamically operated at a 50% duty cycle. The LCD driver receives LCD data from P33, P141, and P140 of the CPU.

• Dimmer circuit

The lamp circuit generates a constant voltage of about 8.8 V with SB, Q202, and D202. The lamp circuit resistance is change by turning Q208 and Q209 on and off to control the dimmer. If the lamp is shorted, Q203 decreases the Q202 V_{BE} to prevent an overcurrent from following through Q202.

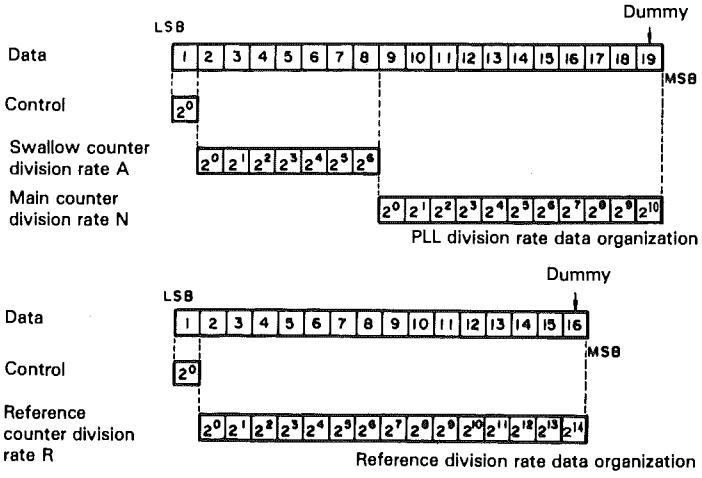

Fig. 14 Data format

• Input and output of CTCSS unit (option)

The optional CTCSS unit receives data from P21, P22, an P73 of the CPU. Figure 14 is a timing chart for CTCSS data transfer, and Figure 15 shows the format of CTCSS data. When a tone from the CTCSS unit is detected, a "H" level signal is sent to P63 of the CPU, opening the squelch.

• Input and output of the remote control unit (option)

When the optional remote control unit is connected, a "H" level signal is applied to INT0 of the CPU, and the following pins have different functions:

P03 → S1 : Serial data input pin
P02 → $\overline{S2}$: Serial data output pin
P01 → $\overline{SCK}$: Serial clock I/O pin

REQUIRED TEST EQUIPMENT

1. **DC V.M and Tester**
   1) High input impedance
2. **RF VTVM (RF V.M)**
   1) Input impedance : 1MΩ min., 2pF max.
   2) Voltage range : F.S = 10mV to 300V
   3) Frequency range: Up to 1200MHz
3. **Frequency Counter (f. counter)**
   1) Input sensitivity : Approx. 50mV
   2) Frequency range: Up to 1200 MHz
4. **DC Power Supply**
   1) Voltage : 10V to 17V, variable
   2) Current 10A min.
5. **Power Meter**
   1) Measurement range : Approx. 30W, 3W, 1W
   2) Input impedance : 50Ω
   3) Frequency range: 1200 MHz
6. **AF VTVM (AF V.M)**
   1) Input impedance : 1MΩ min.
   2) Voltage range : F.S = 1mV to 30V
   3) Frequency range : 50Hz to 10kHz
7. **AF Generator (AG)**
   1) Output frequency : 100Hz to 10kHz
   2) Output voltage : 0.5mV to 1V
8. **Linear Detector**
   1) Frequency range: 1200 MHz
9. **Spectrum Analyzer**
   1) Frequency range: 1200 MHz
10. **Directional Coupler**
11. **Oscilloscope**
    1) High sensitivity oscilloscope with horizontal input terminal
12. **SSG**
    1) Frequency range: 1200MHz band
    2) Modulation: AM and FM MOD.
    3) Output level : 0.1μV to 100mV.
13. **Dummy Load**
    1) 8Ω, 5W (approx.)
14. **Noise Generator**
    1) Must generate ignition-like noise containing harmonics beyond 1200 MHz
15. **Sweep Generator**
    1) Sweep range: 1200 MHz bands
16. **Tracking Generator**

PREPARATION

1) Unless otherwise specified, knobs and switches should be set as follows **Table 8.**

POWER SW	ON	CALL	OFF
AF VOL VR	MIN	BELL/ALERT	OFF
SQL VOL VR	MIN	TONE/T. SHIFT	OFF
VFO	VFO	REV/STEP	OFF
MR	OFF	DR/DT	OFF

Table 8

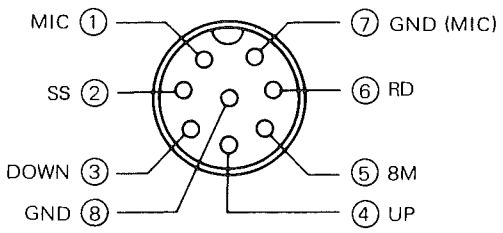

Fig. 17 MIC terminals (view from front panel side)

2) Use an insulated adjusting rod to adjust trimmers and coils.
3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
4) Be sure to turn the power switch OFF, before connecting the power cable to a power source.
5) Meter and display section should be set as follows **Fig. 18.**

DRU-1 (DIGITAL RECORDING UNIT)

DRU-1 CIRCUIT DESCRIPTION

1. Overview

The DRU-1 is a digital recording and playback unit designed to be installed inside the TM-541A/E series. This unit has the following features:

- Recording received audio (for output to the internal speaker) or transmit audio (microphone input)
- Outputting recorded audio to the internal speaker or outputting recorded audio as modulating signals during transmission
- Built-in lithium battery back-up for maintaining DRU-1 contents

2. Operations

• Recording received audio (for output to the internal speaker)

A received signal from the VO pin is fed into pin 1 (0Y) of the multiplexer IC1 (TC4052BF). It is then fed into pin 59 (MIC IN) of IC3 (TC8830F) via pin 3 (Y). The signal is amplified approx. 26dB by a mic amplifier in IC3, and output via pin 60 (C1). The signal from pin 60 is fed into pin 63 (C2) and amplified approx. 20dB. The amplified signal is applied to pin 64 (MIC OUT) and pin 65 (ADI).

• Recording transmit audio (microphone input)

Microphone input from the VI pin is amplified by Q5, and fed into pin 2 (2Y) of the multiplexer IC1 (TC4052BF). It is then supplied to IC3 (TC8830F) via pin 3 (Y) and recorded in the same way as in recording received sound.

• Outputting recorded audio to the internal speaker

D/A convertor output from pin 66 (DAO) of IC3 (TC8830F) is passed through a CR filter, and amplified by Q6. The amplified signal is then fed into pin 13 (X) of the multiplexer IC1 (TC4052BF), and output to the VO pin via pin 14 (1X).

• Outputting recorded audio as modulating signals during transmission

When sound recorded in the DRU-1 is played during transmission, the same operations as written above in outputting recorded audio to the internal speaker occur. That is, D/A convertor output from pin 66 (DAO) of IC3 (TC8830F) is passed through a CR filter, amplified by Q6, and fed into pin 13 (X) of the multiplexer IC1 (TC4052BF). The sound, however, is output via pin 11 (3X).

	VOA (pin 10)	VOB (pin 9)	On channel
Output to speaker	H	L	1X (pin 14)
Output during transmission	H	H	3X (pin 11)
Received audio recording	L	L	0Y (pin 1)
Transmit aidop recording	L	H	2Y (pin 2)

TSU-6 FINE ADJUSTMENT OF TONE FREQUENCY

The tone frequency can be fine adjusted with an interval of 0.5% step over the range of 0 to +1.5%. Ground the T1 (pin 10) and T2 (pin 9) of IC1 to obtain the desired frequency.

	T1	T2
0%	X	X
+0.5%	O	X
+1.0%	X	O
+1.5%	O	O

O : GND, X : OPEN

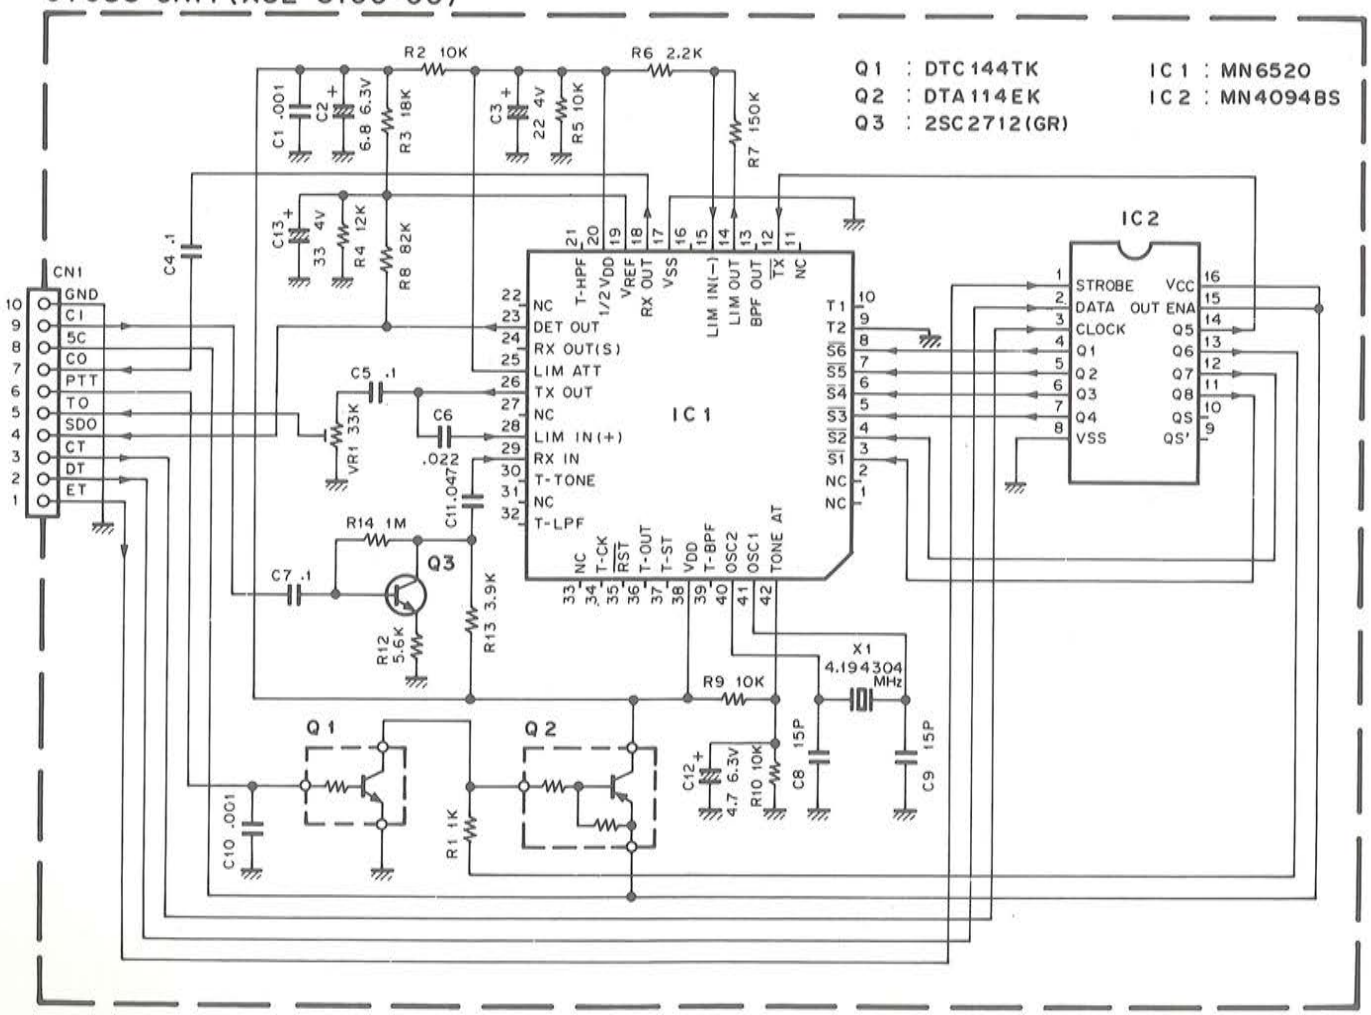
TSU-6 CIRCUIT DIAGRAM

CTCSS UNIT (X52-3100-00)



TM-541A/E

SPECIFICATIONS

TM-541A/TM-541E

General

Frequency range	1240 to 1300 MHz
Mode	F3E (FM)
Antenna impedance	50 ohms
Operating temperature	−20°C to +60°C (−4°F to +140°F)
Power requirement	13.8 VDC ± 15% (11.7 to 15.8)
Grounding	Negative
Current drain	
Transmit mode (Max.)	Less than 6.0A
Receive mode with no input signal	Less than 0.6A
Frequency stability	Less than $\pm 3 \times 10^{-6}$
Dimensions	
Wide	141 mm (5-9/16″)
High	42 mm (1-21/32″)
Deep	171 mm (6-47/64″)
Weight	1.1 kg (2.65 lbs)

Transmitter

*Output power	
HI	10 W
LOW	1 W
Modulation	Reactance modulation
Spurious radiation	Less than −50 dB
Max. frequency deviation	±5 kHz
Audio distortion (at 60% modulation)	Less than 3% (300 to 3000 Hz)
Microphone impedance	500 to 600 ohms

Receiver

Circuitry	Double conversion superheterodyne
Intermediate frequency	
1st	59.7 MHz
2nd	455 kHz
Sensitivity(12 dB SINAD)	Less than 0.16 μV
Selectivity	
−6 dB	More than 12 kHz
−60 dB	Less than 36 kHz
Spurious response	Better than 40 dB
Squelch sensitivity	Less than 0.1 μV
Output (5% distortion)	More than 2 W across 8 ohms load
External speaker impedance	8 ohms

Notes:

1. Circuit and ratings are subject to change without notice due to advancements in technology.
2. * : Recommended duty cycle:
   1 minute : Transmission
   3 minutes : Reception
