INTRODUCTION

General

This manual provides comprehensive instructions for the servicing and maintenance of the frequency synchroniser as used in the Model 1990R suffix "S" receivers. Operating instructions are included in the 1990R receiver handbook, and brief notes are given here for the sake of completeness.

Guarantee

The synchroniser is covered under the same guarantee as the receiver.

Servicing

Spares for user servicing can be supplied and helpful advice will be given freely when required. Any enquiries relating to service matters should be directed to the "Sales and Service Dept." at our usual address.

Should major servicing become necessary, where it has been established that the fault lies in the synchroniser and not in the main part of the receiver, then the synchroniser only may be returned to Eddystone Radio. In other cases the receiver and synchroniser should be returned as a complete unit. The serial number of both receiver and synchroniser should be quoted in all communications and care should be taken to ensure that the equipment is well protected against possible damage during transit.

Section 1

OPERATION

These notes are included for the sake of completeness only. Full details of operating procedures are given in the Model 1990R Receiver Manual.

Controls

TUNING CONTROL SWITCHES

Seven switches allow the receiver frequency to be set, to increments of 100Hz.

TUNE-LOCK SWITCH

In the TUNE position the receiver can be tuned normally. In the LOCK position the Variable Frequency Oscillator in the receiver is locked to the synchroniser.

Tuning

Two methods of operation will be described:—

When the signal frequency is known precisely:

- (a) Adjust the tuning control switches so that an exact readout of the signal frequency is obtained.
- (b) Tune the receiver to the signal frequency. The direction in which the tuning must go is indicated by the two lamps TUNE HIGHER or TUNE LOWER. The lamps will flash alternately when the setting is correct.
- (c) The TUNE/LOCK switch should now be set to LOCK. The receiver is now locked to the frequency set by the synchroniser.

When the signal frequency is not known precisely:

- (a) Tune the receiver to the desired signal using the TUNE control.
- (b) Set the tuning control switches on the synchroniser to give the same frequency read-out as the receiver tuning scale. Slight adjustment of the least significant knob may be necessary to make the indicator lamps flash alternately. The maximum setting accuracy which may be achieved is $\pm 100\text{Hz}$.
- (c) The TUNE/LOCK switch may now be set to LOCK. The receiver is now locked to the frequency set by the synchroniser.
- (d) If the receiver goes off tune when this is done it is an indication that the synchroniser is not set exactly to the signal frequency and more exact adjustment is required. The meter situated between the tuning lamps gives an indication of the degree of synchronism between the receiver and the synchroniser. With the switch in the LOCK position the pointer will rest at centre scale if the two frequencies are identical.

Use of the synchroniser is recommended when using narrow bandwidth filters in the receiver.

If for any reason the receiver is required for use when neither a crystal unit nor a synchroniser is available, this is possible when a dummy unit is used. Details are given in Appendix C.

TECHNICAL DATA & CIRCUIT DESCRIPTION

TECHNICAL DATA

General Specification

(To be read in conjunction with Model 1990R Receiver Specification).

Frequency Coverage

25–500MHz in increments of 100Hz.

Frequency Setting Accuracy

±100Hz. *→ 1 kHz*

Frequency Stability

5 parts in 10^8 /degree C over the range -10°C to $+50^{\circ}\text{C}$.

Dimensions and Weight

Panel: 108 x 127mm (4¼in. x 5in.)

Weight: 2.27kg (5lb).

Power Supplies

All power supplies are derived from the parent receiver.

CIRCUIT DESCRIPTION

This description should be read in conjunction with the circuit diagrams found at the rear of this manual, and with the description of the parent receiver. The upper frequency limit is 235MHz for Model 1990R/1 receivers and 500MHz for Model 1990R/2 receivers.

The major part of the following information is reproduced by kind permission of Marconi Instruments Limited, St. Albans, Herts.

Solid state circuits are employed throughout to ensure long term reliability and the design provides for easy access to all components for servicing.

If desired, the receiver can be used independently by setting the TUNE-LOCK switch to TUNE.

PRINCIPLE OF OPERATION

When the synchroniser is used to lock the frequency of the 1990R as shown in the block diagram Fig. 2.1 the configuration is that of a phase locked frequency synthesizer.

Output from the crystal reference oscillator at a frequency f_r is passed to a series of fixed ratio dividers to produce a reference frequency f_r/m which is applied to one input of a phase detector.

The RF output signal from the VFO at a frequency f_o is passed to a series of variable ratio dividers to produce a signal frequency f_o/n which is applied to the second input of the phase detector.

When the frequency of the oscillator is set so that f_o/n is correctly related to f_r/m the control signal from the phase detector will be held constant.

If the frequency of the variable frequency oscillator drifts, the two frequencies will not be correctly related, causing the AFC signal from the phase detector to change in a manner such that the frequency of the receiver will be corrected.

Output from the variable frequency oscillators can be between 46MHz and 522MHz and it is first necessary to amplify this signal before prescaling it by a factor of 20 to ensure that it never exceeds the frequency handling capability of the variable ratio divider. When the variable ratio divider is set to display the desired frequency by the switches on the front panel of the synchroniser it has a ratio such that when the receiver is tuned to the set frequency, its output is a train of 5Hz pulses. This signal is passed to a sample and hold type phase detector where it is compared with a 50Hz ramp waveform obtained by dividing and shaping the output of an internal 5MHz crystal controlled oscillator. If the receiver frequency is not precisely that set by the synchroniser a correcting voltage will be produced by the phase detector. This voltage is applied to the synchroniser amplifier circuit where it is converted to the correct phase and level for application to the AFC circuits in the receiver. Correct locking is indicated by the "IN LOCK" meter.

CIRCUIT DESCRIPTION

TUNING

When the TUNE-LOCK switch is in the TUNE position, the synchroniser circuit is employed to some extent as a frequency counter. The variable ratio divider then operates to provide 50Hz pulses and these are used as gating signals for a counter consisting of three decade dividers and a flip flop, whose clock frequency is obtained from the standard divider chain and is 50kHz, see Fig. 2.2. When the frequency entering the synchroniser is higher than that displayed by the dials the gating signal will be at a p.r.f. greater than 50Hz so the counter will be re-set before 1000 pulses have been counted and consequently the final flip-flop will change state. The flip-flop drives a monostable circuit which produces outputs to drive the L.E.D. frequency finding indicators. When operating as described, the TUNE LOWER indicator will be lit. When the frequency entering the synchroniser is lower than that set by the switches the flip-flop will change state at regular intervals, this drives the monostable permanently into its triggered state causing the TUNE HIGHER indicator to be lit.

Variable Ratio Dividers and Offset Detector

The local oscillator signal from the receiver is divided by the variable ratio divider to give an output frequency of 5Hz for comparison with the crystal standard in the phase detector. The variable ratio divider is complicated by the necessity to display on the frequency selection knobs the signal frequency which differs from the local oscillator frequency by the amount of the receiver I.F., and it is further complicated because the local oscillator may be above or below the signal frequency depending on the range selected.

The counter counts from a number set by the switches to a higher number set by the offset detector. The first number is the 9's complement of the signal frequency, i.e. $(999\ 999\ 9) - (\text{signal frequency})$, and the second number is $(\text{counters all full}) \pm (\text{receiver I.F.})$, i.e. $(999\ 999\ 9) \pm (021\ 400\ 0)$. In the case of the local oscillator being above the signal frequency the second number is 1 021 399 9 which means that the last stage of the counters can be a simple divide-by-two stage, IC16. The rest of the counting chain consists of presettable divide-by-ten counters, the presetting (in BCD form) is done by the frequency selection switches which are wired so that the 9's complement is set automatically. BCD outputs from the counters are fed into the offset detector. This is programmed by a logic signal derived from the range switch, to recognise either 1 021 399 9 (high offset) or 978 599 9 (low offset), when it produces an output.

Notice that each counting stage resets as it becomes full, a feature which considerably increases the speed of operation. A further increase in speed is needed in the TUNE mode when a more rapid response of the TUNE lamps is desirable. This is done by bypassing one of the decade stages, when the output pulse frequency to the phase detector becomes 50Hz.

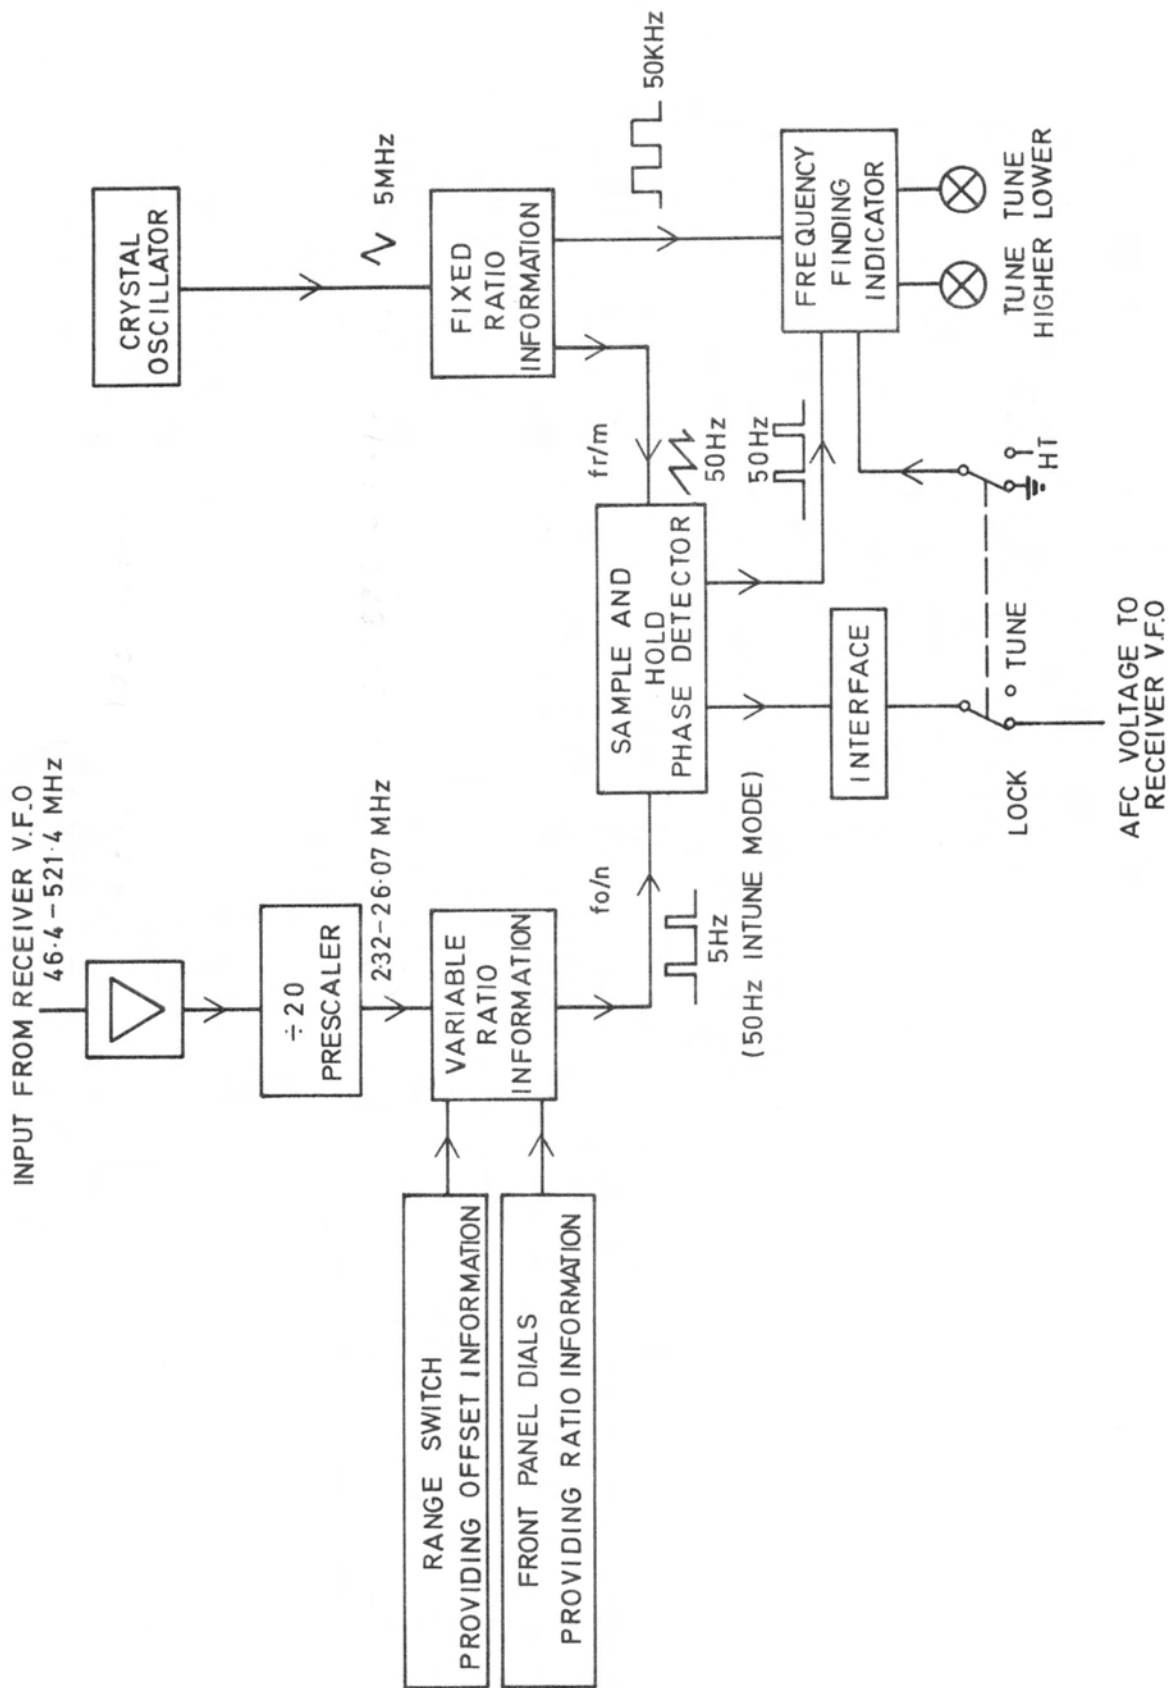

FIG. 2.1. FUNCTIONAL DIAGRAM

FIG. 2.2. FREQUENCY FINDING INDICATOR FUNCTIONAL DIAGRAM

Section 3

MAINTENANCE

The synchroniser employs semi-conductor devices which although having inherent long term reliability can be damaged by overloads, reverse polarity, and excessive heat or radiation. Care should be exercised to ensure that d.c. supplies are not reversed, avoid prolonged soldering, and strong r.f. fields. Before applying continuity or insulation tests or before shorting or breaking a circuit refer to the circuit diagram to establish the effect on the bias arrangement of the devices employed.

When working on the receiver or synchroniser it will be necessary for power to be connected. It is recommended that the receiver is fed from an isolated power supply and that normal precautions for safety under these conditions are observed.

First Aid notes can be found inside the front cover.

OVERALL PERFORMANCE TEST

With the 1990R connected to the supply and switched on, correct performance of the synchroniser can be quickly ascertained by performing the following test:

- 1 Connect a signal generator set to 50MHz to aerial input 1 socket of the 1990R, with receiver set to CW mode. Connect a frequency counter to the audio output of the receiver.
- 2 Set the synchroniser at 50MHz (0-5-0-0-0-0-0) then with the TUNE-LOCK switch at TUNE set the 1990R to 50MHz.
- 3 Set the TUNE-LOCK switch at LOCK – the receiver audio output should give zero beat and the pointer of the lock meter should be within the WHITE BOX on the scale.
- 4 Set only the synchroniser at 50MHz + 10kHz (0-5-0-0-1-0-0) the counter should now display 10.00kHz. The pointer of the lock meter will probably be outside the WHITE BOX but stationary. If the pointer is swinging over the scale locking has not been obtained and a check should be made for faults.

PRELIMINARY CHECKS

- 1 Check to ensure that all switches are undamaged and operating correctly and verify that connectors are securely mated.
- 2 Check using the multimeter on low ohms range that electrical connections to chassis and earth points have low contact resistance.

MAINTENANCE

TEST EQUIPMENT

The use of the following items of test equipment from the list on page 41 of the 1990R Manual is recommended.

Table 3.1

1	Multimeter	(GEC Selectest or Avometer Model 8)
2	Frequency Counter	(Range up to 500MHz 1Hz resolution at 10MHz)
3	H.F. Oscilloscope	(Marconi TF 2210 or equivalent)
4	R.F. Signal Generator	(Marconi TF 2015 or equivalent)

FAULT FINDING

Fig. 3.1 Rear View of Synchroniser

With the synchroniser removed from the receiver and with the synchroniser circuits accessible the cause of incorrect operation can be quickly localized by connecting the assembly to the receiver using connecting cables and then performing the tests given below. The test waveforms may vary slightly from the typical waveforms shown. All waveforms are measured between the point indicated and earth.

Access

- 1 Remove the four screws securing the synchroniser to the receiver and withdraw the synchroniser unit.
- 2 Remove the two 6 BA screws which hold the rear panel.
- 3 Carefully pull the rear panel backwards to the extent of the wiring and remove the push-on tags to the circuit board.
- 4 Remove the screw in the centre of the left-hand side of the synchroniser case.

- 5 With the rear panel positioned to one side carefully slide the cover backwards and remove it. Reconnect the wiring removed in step (3) and connect the extension cable to the 8-way sockets in the receiver and on the rear panel of the synchroniser.

TESTING AND REALIGNMENT

Input Amplifier (Board A2)

- 1 Connect an r.f. input of 100mV rms at 20MHz to the synchroniser r.f. input.
- 2 Connect the oscilloscope to the junction of R19 and R20. The waveform should be similar to that shown below, if necessary adjust RV2 for amplitude of 850mV.

Fig. 3.2

- 3 If an output is not obtained check that the supply voltages are present and check for output signals at the collectors of VT1 and VT2.

Prescaler

- 1 Connect the oscilloscope to the collector of VT4. The waveform should be similar to that shown below. If necessary adjust RV1 so that the correct frequency is obtained (if more than one setting gives the correct frequency, use the one nearest the centre of the range).

Fig. 3.3

If no output is obtained check for signals at IC2 pin 13 and junction of R11 and R12.

Variable Ratio Divider and Offset Detector (Boards A2 and A3)

- 1 Set the r.f. input to 100mV at 40MHz, the frequency selection switches to 0-1-8-6-0-0-0, the TUNE-LOCK switch to TUNE, and the receiver to range 1. Connect the oscilloscope to pin 33 on the printed circuit board. The waveform should be similar to that shown below.

Fig. 3.4

- 2 Check that the waveform is the same for the receiver on ranges 2, 3, 4, 6 and 7.
- 3 Set the frequency selection switches to 0-6-1-4-0-0-0 and the receiver to range 5. The waveform should be the same.
- 4 Set the frequency selection switches to 0-8-1-4-0-0-0. The pulse spacing should now be 30mS.
- 5 Set the r.f. input to 100mV at 20MHz, frequency selection switches to 0-2-0-0-0-0-0 and the TUNE-LOCK switch to LOCK. Connect the oscilloscope to IC7 pin 8. The waveform should be similar to (A) below. Set the TUNE-LOCK switch to TUNE, the waveform should be similar to (B) below.

Fig. 3.5 (a) above (b) below

Standard Divider, Ramp Generator, Sample and Hold Circuits (Board A5)

Set the r.f. input to 100mV at 41.4MHz, frequency selection switches to 0-2-0-0-0-0-0, the TUNE-LOCK switch to TUNE and the receiver to range 1.

- 1 Connect the counter to the 5MHz output on the rear panel and check that the measured frequency is $5.0\text{MHz} \pm 0.5\text{Hz}$. Adjust RV1 if necessary to obtain this frequency.
- 2 Connect the oscilloscope to IC1 pin 1. The waveform should be similar to that shown below.

Fig. 3.6

- 3 Connect the oscilloscope to TP1. The waveform should be similar to that shown below. If it is not present check for signal outputs at IC1 pin 12, IC2 pin 12, IC4 pin 12, IC7 pin 11 and IC9 pin 11.

Fig. 3.7

- 4 Connect the oscilloscope to TP2 for the waveform below.

Fig. 3.8

MAINTENANCE

- 5 Connect the oscilloscope to VT7 source for the waveform below.

Fig. 3.9

- 6 Connect the oscilloscope to VT4 collector for the waveform below.

Fig. 3.10

- 7 Connect the oscilloscope to VT6 collector for the waveform below.

Fig. 3.11

- 8 Connect the oscilloscope to IC3 pin 14 for the waveform below.

Fig. 3.12

L.E.D. Circuits (Board A5)

- 1 Set the r.f. input to 100mV at 41.4MHz, the frequency selection switches to 0-2-0-0-0-0 the TUNE-LOCK switch to TUNE and the receiver to range 1.

Connect the oscilloscope to IC3 pin 2 and check that the waveform is similar to that shown below.

Fig. 3.13

- 2 Connect the oscilloscope to IC13 pin 3 for the waveform below.

Fig. 3.14

- 3 Connect the oscilloscope (d.c. coupled) to IC13 pin 8.

Set the r.f. input to 40MHz, the voltage should be nominally +5V.

Set the r.f. input to 42MHz, the voltage should be nominally 0V.

MAINTENANCE

Meter Circuits (Board A4)

Set the r.f. input to 100mV at 41.4MHz, the frequency selection switches to 0-2-0-0-0-0 and the receiver to range 1. With the TUNE-LOCK switch set to TUNE the two lamps should be flashing. Set the switch to LOCK and allow locking to occur. Adjust RV1 if necessary so that the meter pointer lies in the centre of the white block on the scale. Board A4 is located behind the front panel adjacent to the meter.

APPENDIX A

LIST OF COMPONENTS

Each of the printed circuit boards is allocated a reference number, which is marked on each board. Miscellaneous components are allocated the reference A1. This reference number forms the prefix of the component circuit reference, which should always be quoted in full when ordering spares, but for brevity it is omitted on the circuit diagram and on the printed circuit board legend, where there is no risk of ambiguity.

All orders and enquiries should be directed to the address below, quoting: Type, No. of Receiver, Serial No. of Receiver and Serial No. of Synchroniser in all communications.

APPENDIX A

Integrated Circuits (Cont.)

Ref.	Type
A5IC7– A5IC10 A5IC11 A5IC12– A5IC15	SN7490N SN7420N TT _μ L9601

Miscellaneous

Ref.	Type
A1 M1	Tune Meter 100 _μ A-0-100 _μ A
A1 SA	Frequency Selection Switch Hz x 100 4p 10W
A1 SB	Frequency Selection Switch kHz x 1 4p 10W
A1 SC	Frequency Selection Switch kHz x 10 4p 10W
A1 SD	Frequency Selection Switch kHz x 100 4p 10W
A1 SE	Frequency Selection Switch MHz x 1 4p 10W
A1 SF	Frequency Selection Switch MHz x 10 4p 10W
A1 SG	Frequency Selection Switch MHz x 100 4p 10W
A1 SH	Tune-Lock Switch 2p 2W
A5 X1	5MHz Crystal Oscillator Unit QC1311/A
–	Switch Control Knobs comprising: Knob body, Elma 70-14-14 Black Cap, Elma 1450-14 Black Figure Dial, Elma 1452-14/1 Stator, Elma 1453-14/1
A2	Variable Divider Board, Part No. 44827-261
A3	Offset Detector Board, Part No. 44827-262
A4	Meter Drive Board, Part No. 44827-287
A5	Standard Divider Board, Part No. 44827-315
–	Meter Shunt Board, Part No. 44559-015
	8-way plug BNC plug-fixed Ribbon Cable

APPENDIX B

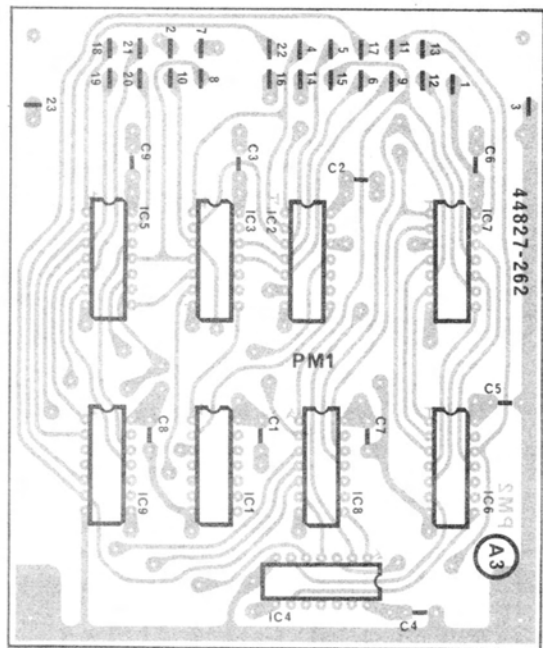

CIRCUIT DATA

All printed circuit boards are shown viewed from the legend side, i.e. the front face. Double sided boards are shown twice, firstly with the front copper track and legend superimposed, and secondly with the rear copper track (as seen through the laminate) and legend superimposed.

The two divider boards and the offset detector board are double sided and are shown slightly less than actual size, whilst the meter drive board which is single sided is shown enlarged. The meter shunt board carries two resistors only and is not shown.

OFFSET DETECTOR BOARD
showing front copper track

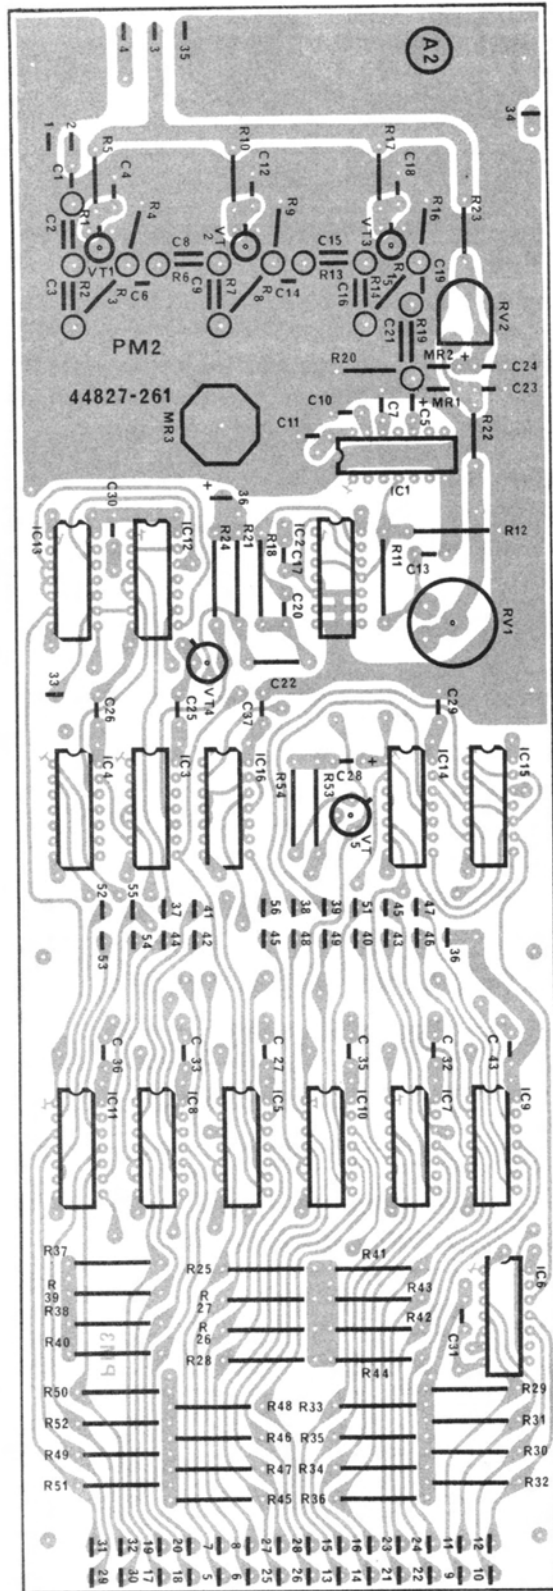

OFFSET DETECTOR BOARD
showing rear copper track

METER DRIVE BOARD
showing rear copper track

VARIABLE RATIO DIVIDER BOARD
showing front copper track

VARIABLE RATIO DIVIDER BOARD
showing rear copper track

STANDARD DIVIDER BOARD
showing front copper track

STANDARD DIVIDER BOARD
showing rear copper track

APPENDIX C

USING THE RECEIVER WITHOUT A CRYSTAL UNIT OR SYNCHRONISER

It is possible to use the receiver without either a crystal unit or a synchroniser provided certain connections are made to restore the circuits lost. Certain performance parameters will of course suffer but the receiver will be operational for emergency purposes. The connections are shown below:

NOTE: SKB is the socket for the crystal unit, which is used for convenience only. PLB is Part No. 7772P. Adjust the potentiometer for $-5.1V$ on B8.

SYNCHRONISER EXTENSION LEAD

The lead is required to operate the synchroniser out of the receiver. It should be approx. 800mm (31½") long.
