Cut out the label at the right and place it behind the clear plastic window in the spine of the manual binder.

FT-2400H
Technical Supplement

GENERAL INFORMATION

The FT-2400H is a special version of Yaesu's top-of-the-line professional grade commercial land mobile transceivers, intended for 2-meter FM operation in the amateur radio service.

With its compartmentalized one-piece die-cast chassis, the FT-2400H provides 3-step user-selectable power output up to 50 watts easily without forced cooling. Backlighting for the large LCD (display), knobs and major buttons is automatically controlled by a photosensor, and the less-used buttons have a flip-down protective cover.

The thirty-one freely tunable memories can each be programmed with a 4-character channel name, which can then be displayed in place of frequency, as desired. Each memory offers complete programmability and scanning functions, such as independent tx/rx frequencies, independent repeater offset and CTCSS tone, programmable scan limits, selectable scan resume modes and memory skip, priority monitoring and a 1-touch instant-recall CALL channel. Channel steps are user-selectable from 5 to 50 kHz, and Automatic Repeater Shift can set standard repeater shifts when you tune

to a repeater subband. A 1750-Hz tone generator is included in European versions.

A 38-tone programmable CTCSS encoder is built-in as standard, and the FTS-17A CTCSS decoder unit can be installed to provide tone squelched private channels and a CTCSS paging bell feature to sound a paging alert tone when the tone squelch opens.

Revolutionary DTMF (Dual-Tone, Multi-Frequency) -based selective calling and private paging capabilities can be easily added with the optional FRC-6, controlled entirely from the front panel. You can select any of 999 3-digit ID codes for your transceiver, and then have your receiver stay quiet until your code is received (from any standard DTMF-equipped transceiver). When a call is received, the FT-2400H displays the caller's code, and a paging beeper can be set to sound and even to respond to the call automatically. Seven DTMF code memories store your ID plus those of six other frequently-called stations or groups you wish to monitor.

SPECIFICATIONS

General

Frequency Range: 144 ~ 146 or 148 MHz, or
140 ~ 150 MHz Tx, 140 ~ 174 MHz Rx

Channel Steps: 5, 10, 12.5, 15, 20, 25 & 50 kHz

Frequency Stability: < 10 ppm (-20 to +60 °C)

Mode of Emission: F3

Antenna Impedance: 50 ohms, unbalanced

Supply voltage: 13.8V DC \pm 10%, negative
ground

Current Consumption (typical):
Rx: 400 mA, Tx hi/med/low: 12/9/5A

Operating Temperature Range: -20 to +60 °C

Case Size (WHD):
160 \times 50 \times 180 mm (w/o knobs)

Weight: 1.5 kg (3.3 lb)

Transmitter

Output Power (high/med/low): 50/25/5W

Modulation Type: Variable Reactance

Maximum Deviation: \pm 5 kHz

Spurious Radiation: less than -60 dB

Microphone Impedance: 2k Ω

Receiver

Circuit Type:
Double Conversion Superheterodyne

IFs: 21.4 MHz & 455 kHz

Sensitivity (for 12dB SINAD):
better than 0.2 μ V

Selectivity (-6/-60 dB): 12/30 kHz

IF Rejection: better than 70 dB

Image Rejection: better than 70 dB

Maximum AF Output:
2W into 8 ohms @10% THD

Specifications subject to change without notice or obligation.

CIRCUIT DESCRIPTION

Receive Signal Path

Incoming RF from the antenna jack is delivered to the Main Unit and passed through a lowpass filter and a $\frac{1}{4}$ -wave antenna switching network consisting of coils L1003 & L1004, capacitors C1003 & C1004, and diodes D1001 & D1002. Signals within the frequency range of the transceiver are then passed through a varactor-tuned bandpass filter consisting of T1001/T1002 before RF amplification by Q1001 (3SK131). The amplified RF is then bandpass filtered again by varactor-tuned resonators T1003/T1004, to ensure pure in-band input to 1st mixer Q1002/Q1003 (2SK302 \times 2).

Buffered output from the VCO Unit is amplified by Q1005 (2SC2759) and lowpass filtered by L1009 and C1042/C1043, to provide a pure 1st local signal between 118.6 and 152.6 MHz to the 1st mixer. The 21.4-MHz 1st mixer product is passed through dual monolithic crystal filter XF1001 (\pm 7.5 kHz BW) to strip away all but the desired signal, which is then amplified by Q1004 (2SC2714).

The amplified 1st IF signal is applied to FM IF subsystem IC Q1008 (MC3372M), which contains the 2nd mixer, 2nd local oscillator, limiter amplifier, noise amplifier, S-meter amplifier and squelch gates. A 2nd local signal is generated from 21.855 MHz crystal X1001, which produces the 455 kHz 2nd IF when mixed with the 1st IF signal within Q1008. The 2nd IF is passed through ceramic filter CF1001 to strip away unwanted mixer products, and then applied to the limiter amp in Q1008, which removes amplitude variations in the 455 kHz IF before detection of the speech by ceramic discriminator CD1001.

Detected audio is delivered from Q1008 to the Interface Unit, where it passes through audio muting analog switch Q3005 (TC4S66F) before de-emphasis, high-pass and low-pass filtering by Q3006 (NJM2902M- $\frac{4}{4}$, - $\frac{2}{4}$ & - $\frac{1}{4}$). Another audio muting gate, Q3012 (DTC114TK), passes the signal, which is then combined with beeper audio originating from the microprocessor through Beeper volume trimmer VR3002 and lowpass filter Q3006 (NJM2902M- $\frac{3}{4}$). The level of the combined receiver and beeper audio on the Interface Unit is set by VOL potentiometer VR2002 on the Control Unit (via J3003 pin 3) and is then returned the Main Unit for amplification by Q1023 (TDA2003) up to 2 watts for the optional headphone jack or 8-ohm loudspeaker.

Squelch Control

The squelch circuit consists of noise amplifier Q1007 (2SC2712GR) and a highpass filter and squelch trigger within Q1008 on the Main Unit, and control circuitry within microprocessor Q2001 (HD404719-A11H) on the Control Unit.

When no carrier is received, noise at the output of the detector stage in Q1008 is amplified by Q1007 and highpass filtered by the noise amp section of Q1008, and then rectified by D1012 to provide a DC control voltage for the squelch switching section within Q1008. With no carrier, pin 14 of Q1008 is high. This signal is inverted by Q1006 (IMH5) and delivered to BUSY pin 16 of main microprocessor Q2001 on the Control Unit as the Scan Stop signal, which causes the **BUSY** indication on the display when the squelch is open. This signal also causes the microprocessor to cut receiver audio in two places on the Interface Unit mentioned already: opening audio mute gate Q3005 (via switch Q3004, DTC114EK), and pulling the audio line to ground just before the audio amplifier at Q3012, thus silencing the receiver while no signal is being received, and during transmission.

When a carrier appears at the discriminator, noise is removed from the output, causing pin 14 of Q1008 to go low. This signals the microprocessor to activate the **BUSY** indicator through LCD driver Q2002 (LC7582). The microprocessor then checks for CTCSS tone detection from the FTS-17A Tone Squelch Unit (if installed), and for Digital Code Squelch information (if the FRC-6 DCS Unit is installed). If not transmitting and tone squelch is not activated, or if the received tone matches that programmed, the microprocessor switches Q3004/-Q3005 and Q3012 to allow audio to pass to the amplifier and loudspeaker.

Center-Stop Scanning

To ensure that scanning stops at the center of a detected signal, discriminator output from pin 9 of Q1008 is also delivered to comparator circuit Q3008 (LA6324M- $\frac{2}{4}$ & - $\frac{3}{4}$) on the Interface Unit, which compares the discriminator output to a preset DC level. The output of the comparator connects to the Scan Stop line, preventing the received signal from signalling the microprocessor to stop scanning until the signal has been tuned to its peak level, preset by Center-Stop trimmer VR3004.

CIRCUIT DESCRIPTION

Transmit Signal Path

Speech input from the microphone is delivered via the Mic (Jack) Unit and the Control Unit to the Interface Unit, where it passed through Mic Mute analog switch Q3009 (TC4S66F) for amplification and pre-emphasis by Q3007 (LA6324M- $\frac{1}{4}$). To prevent over-deviation, the audio is processed by IDC (instantaneous deviation control) stage Q3007- $\frac{1}{4}$, and then lowpass filtered by Q3008 (LA6324M- $\frac{1}{4}$ & - $\frac{1}{4}$) before delivery to the modulator on the VCO Unit. Q3007- $\frac{3}{4}$ provides a low impedance reference for the lowpass filter input and some of the other opamps.

If a CTCSS tone is enabled for transmission, the subaudible tone from microprocessor Q2001 on the Control Unit is lowpass filtered by Q3007- $\frac{2}{4}$ and mixed with the IDC-processed speech audio. Also, DTMF tones generated by the FRC-6 option (connected to the PRG Unit jack), or directly from the microprocessor, are applied to the transmit audio chain at the input of the IDC stage. The microprocessor also disables microphone at Mic Mute switch Q3009 via Q3010 (DTC114EK) when necessary.

The modulating audio is delivered to diode D305 (HVU202) on the VCO Unit, frequency modulating the PLL carrier up to ± 5 kHz from the unmodulated carrier at the transmitting frequency. The modulated signal from transmitter VCO Q303 (MMBR951L) is buffered by Q305 (2SC2759) and delivered to the Main Unit for amplification by Q1012 (2SC2759), Q1011 (MMBR951L) and Q1010 (2SC2538). The low level transmit signal is then finally amplified by PA module Q1009 (S-AV24) up to 50 watts. Harmonic spurious radiation in the final output is suppressed by a 3-pole lowpass filter on the Main Unit, and the transmit signal then passes through $\frac{1}{4}$ -wave antenna switch D1016 before delivery to the antenna.

Automatic Transmit Power Control

RF power output from the final amplifier is sampled by C1064 and rectified by D1017 (1SS108). The resulting DC is passed by high/medium/low power controller Q1017 (FMS1) and transmit inhibit gate Q1018 (IMX1) to Automatic Power Controller Q1019 (2SB986S) which regulates supply voltage to transmitter RF amplifiers Q1010 and Q1011, so as to maintain stable high, medium or low output power under varying antenna loading conditions.

Spurious Suppression

Generation of spurious products by the transmitter is minimized by the fundamental carrier frequency being equal to the final transmitting frequency, modulated directly in the transmit VCO. Additional harmonic suppression is provided by a 3-pole lowpass filter consisting of L1002, L1013, L1014 and C1002, C1062, C1063, C1065-C1067, C1152 and C1153, resulting in more than 60 dB harmonic suppression (for transmitting frequencies in the amateur band) prior to delivery to the antenna.

PLL Frequency Synthesizer

PLL circuitry on the Main Unit consists of swallow counter Q1025 (MC12022SLAD) and PLL subsystem IC Q1024 (MC145158F2), which contains a reference oscillator/divider, serial-to-parallel data latch, programmable divider and a phase comparator. Stability is obtained by a regulated 5-V supply via Q1014 (2SC2712GR) to Q1024 and temperature compensating capacitors associated with 12.8-MHz frequency reference crystal X1002.

Receiver VCO Q301 (MMBR951L) on the VCO Unit oscillates between 118.6 and 152.6 according to the programmed receiving frequency. The VCO output is buffered by Q305 (2SC2759) on the VCO Unit, and then returned to the Main Unit where a sample of the output is buffered by Q1028 (2SC2714) for application to prescaler/swallow counter Q1025. There the VCO signal is divided by 64 or 65, according to a control signal from the data latch section of Q1024, before being applied to the programmable divider section of the PLL chip.

The data latch section of Q1024 also receives serial dividing data from microprocessor Q2001 on the Control Unit, which causes the predivided VCO signal to be further divided by 23,720 — 30,520 in the programmable divider section, depending upon the desired receive frequency, so as to produce a 5-kHz or 6.25-kHz derivative of the current VCO frequency. Meanwhile, the reference divider section of Q1024 divides the 12.8-MHz crystal reference by 2560 (or 2048) to produce the 5-kHz (or 6.25-kHz) loop reference (respectively).

The 5-kHz (or 6.25-kHz) signal from the programmable divider (derived from the VCO) and that derived from the crystal are applied to the phase detector section of Q1024, which produces a dual 5-V pulsed output with pulse duration depending on the phase difference between the input

CIRCUIT DESCRIPTION

signals. This pulse train is converted to DC by charge pump Q1026/Q1027 (IMX3/IMZ2), low-pass filtered, and then fed back to varactors D301 and D302 (1T363 × 2) on the VCO Unit.

Changes in the level of the DC voltage applied to D301/D302 affect the reactance in the tank circuit of VCO Q301, changing the oscillating frequency according to the phase difference between the signals derived from the VCO and the crystal reference oscillator. The VCO is thus phase-locked to the crystal reference oscillator.

The output of receiver VCO Q301, after buffering by Q305, is delivered to the Main Unit for amplification by Q1005 before application to the 1st mixer, as described previously.

Transmitter VCO Q303 (MMBR951L) oscillates between 140 and 174 MHz according to the programmed transmit frequency. The remainder of the PLL circuitry is shared with the receiver. However, the dividing data from the microprocessor is such that the VCO frequency is at the actual transmit frequency (rather than offset for IFs, as in the receiving case). Also, the transmitter VCO is modulated by the filtered speech audio applied to modulating varactor D305, as described previously. If the FRC-6 Digital Coded Squelch option is installed, DCS modulation is applied both to the VCO and to the PLL frequency reference, via varactor D1021 (HVU202).

Transmit Inhibit

When the transmit PLL is unlocked pin 7 of PLL chip Q1024 goes to a logic low, turning on Q1020 (DTA143EK) and turning off half of Q1018. This unlock signal produces a low impedance at the base of the other half of Q1018, which then turns off Automatic Power Controller Q1019 to disable the supply voltage to transmitter RF amplifiers Q1010 and Q1011, disabling the transmitter.

Miscellaneous Circuits

Power-On Sequencing & Panel Lamps

Pressing the **POWER** switch on the front panel turns on Q2007 (2SA1162GR) on the Control Unit, applying 5 volts from regulator Q2004 (RH5VA-45AA) via Q2003 (NJU7201U50) and the 13.8-V supply line to the base of Q2012 (DTC114EK). This pulls PO KEY pin 38 of microprocessor Q2001 low, causing PO ON pin 19 to go high. The PO ON line then pulls the base of Q2018 (2SB1301-ZQ) low via Q2015 (FMG8), lighting the pilot lamps via Q2014 (2SD1033K) and Q2010 (2SB1301-ZQ). Lamp brightness is controlled by CdS photosensor CS2001, opamp Q2009 (NJM2904M- $\frac{1}{2}$), and transistor Q2011 (2SC2712GR), powered by regulator Q2013 (NJU7201U50).

When Q2015 is turned on by the PO ON line, it turns on Q3001 (DTA114EK) on the Interface Unit, which in turn allows Q3002 (2SB1140S) to pass 13.8 volts to regulator Q3003 (HA17808P), and to 9-volt regulator Q1013, audio amplifier Q1023 and APC switch Q1019 on the Main Unit.

Push-To-Talk Transmit Activation

The PTT switch on the microphone is connected to pin 17 of microprocessor Q2001, so that when the switch is closed pin 12 (tx/rx) goes low. This signal is delivered to power bus controller Q1021 (IMH5) on the Main Unit, which then disables the receiver by disabling the 9-V supply bus at Q1022 (DTA143EK) to the front end, IF, discriminator and receiver VCO circuitry. At the same time, Q1015 (2SB986S) activates the transmit 9-V supply line to enable the transmitter.

ALIGNMENT

The FT-2400H has been carefully aligned at the factory for the specified performance across the amateur band. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized Yaesu representative, or the warranty policy may be voided.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Yaesu service technicians who are experienced with the circuitry and fully

equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Yaesu service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and

Case Disassembly

- Make sure the transceiver is off. Loosen the screws on the heatsink and remove the top and bottom covers. The Control Unit is now accessible on the top of the chassis.
- In the bottom of the set, remove the 5 screws from the shield cover, and remove the shield to gain access to the Main Unit.

ALIGNMENT

the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- RF Signal Generator with calibrated output level at 200 MHz
- Deviation Meter (linear detector)
- Oscilloscope
- AF Millivoltmeter
- SINAD Meter
- Inline Wattmeter with 5% accuracy at 200 MHz
- Regulated DC Power Supply adjustable from 10 to 17V, 15A
- 50-Ω Dummy Load: 100W at 200 MHz
- Frequency Counter: ± 0.2 ppm accuracy at 200 MHz
- AF Signal Generator
- DC Voltmeter: high impedance
- Spectrum Analyzer
- VHF Sampling Coupler

Alignment Preparation & Precautions

A 50-Ω dummy load and inline wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30 °C (68 ~ 86 °F). When the transceiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment.

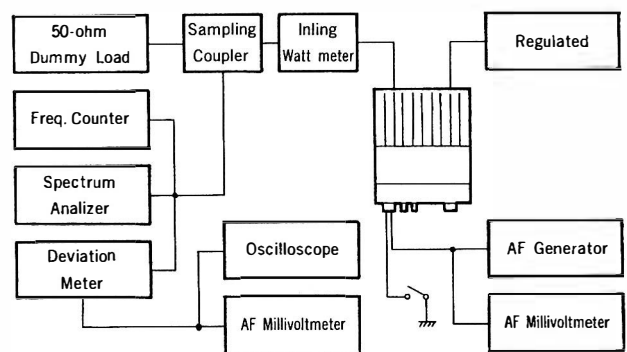

Alignments must only be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in the alignment procedure are based on $0 \text{ dB}\mu = 0.5 \text{ dB}\mu\text{V}$.

PLL & Transmitter

Set up the test equipment as shown here for transmitter alignment. Maintain the supply voltage at 13.6V for all steps.

PLL & Transmitter Alignment Setup

PLL VCV (Varactor Control Voltage)

- Connect the positive lead of the DC voltmeter to the test point near C1141 on the Main Unit, as indicated below, and the negative lead to chassis ground.

ALIGNMENT

PLL & Transmitter Alignment Points

- ❑ Set the transceiver to 174.000 MHz, and adjust coil L303 on the VCO Unit for 6.8 V on the voltmeter.
- ❑ Retune to 140.000 MHz, and confirm at least 0.8V on the meter.
- ❑ Tune to 174.000 MHz again, and this time key the transmitter while adjusting coil L304 on the VCO Unit for 6.5V on the voltmeter.
- ❑ Again retune to 140.000 MHz, key the transmitter, and confirm at least 1V on the meter.
- ❑ Tune to 146.000 MHz and confirm the VCV is between 1.3 and 2.0V.

PLL Reference Frequency

- ❑ With the wattmeter, dummy load and frequency counter connected to the antenna jack, and while tuned to 146.000 MHz, key the transmitter and adjust TC1001 on the Main Unit, if necessary, so the counter frequency is within 100 Hz of 146.000 MHz.

Transmitter Output Power & APC

- ❑ Preset trimmer potentiometers VR3006, VR3007 and VR3008 fully clockwise.
- ❑ While tuned to 146.000 MHz, press the **LOW** button on the panel to select high, medium and

then low power while adjusting these potentiometers for the corresponding transmitter power output levels listed below:

Panel Power Selection	Adjustment	Power Output
High	VR3008	50 ± 5W
Medium	VR3006	25 ± 1W
Low	VR3007	5 ± 1W

Transmitter Deviation

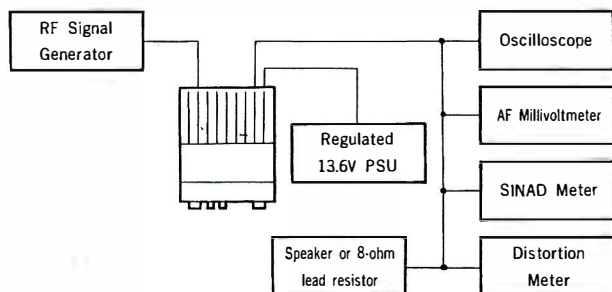

- ❑ While tuned to 146.000 MHz, adjust the AF generator attenuator for 50 mV output at 1 kHz to the **MIC** jack.
- ❑ Key the transmitter and adjust VR3001 on the Interface Unit for ±4.8 kHz deviation on the deviation meter (within 100 Hz).
- ❑ Press **F/W** → **TONE** and select the 88.5-Hz CTCSS tone. Then press **TONE** again once or twice (so that "**ENC**" is displayed) to enable 88.5-Hz CTCSS tone generation.
- ❑ Reduce the AF generator injection to zero. Key the transmitter, and adjust VR3003 on the Interface Unit for ±0.7 kHz deviation (within 100 Hz).

ALIGNMENT

Receiver

Set up the test equipment as shown below for receiver alignment.

Receiver Alignment Setup

Receiver Alignment Points

Interstage Transformers

- Connect the DC voltmeter between J1003 pin 7 and chassis ground.
- Modulate the RF signal generator with ± 3.5 kHz deviation of a 1-kHz tone.
- Adjust T1001 through T1004 on the Main Unit for maximum voltage on the meter, then adjust T1006 for optimum SINAD (at least -7 dB μ for 12 dB SINAD).

S-Meter Calibration

- While tuned to 146.000 MHz, inject 25 dB μ RF modulated with ± 3.5 kHz deviation of a 1-kHz tone, and adjust VR3005 on the Interface Unit so that all S-meter segments are just on.

Scanner Center-Stop

- Connect the DC voltmeter (3-V range) between TP3001 (+) and TP3002 (-) on the Interface Unit.
- With both the transceiver and signal generator tuned to 146.000 MHz, set the SQL fully counterclockwise (the BUSY indicator should be on). Inject 20 dB μ RF modulated with ± 3.5 kHz deviation of a 1-kHz tone, and adjust VR3004 on the Interface Unit for zero volts on the voltmeter.

Squelch

- At the center of the band, tune the RF signal generator to the same frequency, and set the generator level to -12 dB μ .
- Turn VR1001 clockwise until the squelch just closes, and then counterclockwise very slightly so that it just opens.

Component Notes:
Unless otherwise noted, resistor values are in ohms, $\frac{1}{10}$ -watt; capacitor values are in μ F, 50-WV; (T)-marked capacitors are tantalum and inductor values are in Henries.

Receiver test signal: 144.02-MHz, 20-dB μ injected through 0.001- μ F capacitor at the Antenna jack. Signal levels are relative to 12-dB SINAD.

Component Notes:

Unless otherwise noted, resistor values are in ohms, 1/10-watt; capacitor values are in μF , 50-WV; (T)-marked capacitors are tantalum and inductor values are in Henries.

F3226100

Voltage Measurement Conditions:

No optional tone units installed.
Receive: 145.02-MHz, 20-dB μ signal injected at the Antenna jack with 70% modulation of a 1-kHz tone (± 3.5 kHz deviation), squelch open.
Transmit: 1000-Hz, 5-mVrms signal injected at the microphone jack, with 50-W RF output.

INSTALLATION OF OPTIONS (FRC-6)

FRC-6 DTMF Pager Installation & Alignment

The FRC-6 provides DTMF paging/selcall features using 3-digit DTMF station ID codes. Seven code memories store your ID code plus those of six frequently-called stations or groups. Control is provided through the front panel of the transceiver. See the *FT-2400H Operating Manual* for operational details.

- Disconnect the DC power cable, and referring to Figure 1, remove the four screws affixing the top cover (two on either side), and loosen the one on top from the back by several turns. Lift the rear edge of the cover slightly, then remove it.
- Referring to Figure 2, note the accessory mounting location for the FRC-6 over the larger of the two empty white connectors.
- Carefully align the pins on the FRC-6 with the connector, and press it into place.
- The factory adjusts the output tone level (the small trimmer accessible through the FRC-6 board) for the proper deviation, so it should

require no further adjustment. The alignment procedure is listed below, however, if needed.

- Replace the top cover and four screws removed in the first step, and remember to tighten the screw at the back of the top panel from the rear.

Alignment

- Select 20-kHz tuning steps on the transceiver (press **F/W** → **A/N STEP**, turn the selector knob for 20-kHz displayed steps, and press **A/N STEP** again).
- Connect the test equipment as shown on the following page, and temporarily connect a 4.7-kilohm resistor between pins 7 and 12 on the installed FRC-6, as shown below (this causes a DTMF tone to be emitted continuously).
- Adjust VR101 on the FRC-6 for ± 3.5 to 4.7 kHz deviation during transmission, with no microphone input.
- Set the AF generator for 50 mV output at 1 kHz, and adjust trimmer potentiometer VR3001 for ± 4.8 kHz deviation during transmission.

INSTALLATION OF OPTIONS (FTS-17A)

FTS-17A CTCSS Encoder/Decoder Installation & Alignment

The FTS-17A includes a decoder for 38 EIA standard subaudible CTCSS tones, programmable from the front panel of the FT-2400H. It provides silent monitoring of busy channels when activated by the **ENC**ode/**DEC**ode Tone Squelch function.

- Disconnect the DC power cable, and referring to Figure 1 on the previous page, remove the four screws affixing the top cover (two on either side), and loosen the one on top from the back by several turns. Lift the rear edge of the cover slightly, then remove it.
- Referring to Figure 5 below, note the accessory mounting location for the FTS-17A over the smaller of the two empty white connectors. Remove the paper from the double-sided adhesive pad.
- Carefully align the pins on the FTS-17A with the connector, and press it into place.

- The factory adjusts the output tone level (the small trimmer accessible through the FTS-17A board) for the proper deviation, so it should require no further adjustment. The alignment procedure is listed below, however, if needed.
- Replace the top cover and four screws removed in the first step, and remember to tighten the screw at the back of the top panel from the rear.

Alignment

- Select 20-kHz tuning steps on the transceiver (press **F/W** → **A/N STEP**, turn the selector knob for 20-kHz displayed steps, and press **A/N STEP** again).
- Connect the test equipment as shown below, and adjust VR101 on the FTS-17A for ± 0.7 kHz deviation during transmission, with no microphone input.
- Set the AF generator for 50 mV output at 1 kHz, and adjust trimmer potentiometer VR3001 for ± 4.8 kHz deviation during transmission.
